Products that deliver next generation IP

IP Call Router + IP Call State Server

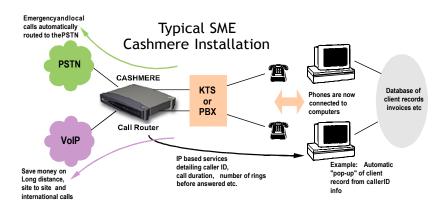

Cashmere allows you to take your current phone system and with a small investment and low risk - migrate it to deliver the majority of the new capabilities of an all IP implementation. Use VoIP service providers without risk by:

- Using the PSTN as a safety net in the event of network problems.
- Route E911 to the PSTN so that this service works in the traditional, reliable manner.

The call state server provides information on the call state (ie ringing, inbound answered, outbound local, outbound long distance, caller name and number etc.) that applications can subscribe to. For example:

- The caller's name or number can be used to drive client record pop up.
- Create call logs that encompass both VoIP and PSTN trunks to simplify billing for lawyers, consultants etc.
- Remotely monitor phone activity in branch offices, home workers to ensure the company's facilities are being used properly.

Both the IP call router and the IP call state server are contained in the Cashmere unit.
